

Configuration Geometry And Sampling

The configuration knobs are physical sampling choices on the aperture: how many spider-web lines are kept, and therefore how many bead-pull points survive per gap.

Aperture Grid And Spider-Web Lines

What The Sampling Knob Does

line_count keeps the first N spider tracks.
 $|y - (a x + b)| \leq 3$ mm decides whether a point survives.
More lines mean denser in-plane sampling.

Default Line Equations

L1: $y = +0.15 x + 80$ mm
L2: $y = -0.15 x + 40$ mm
L3: $y = +0.15 x + 0$ mm
L4: $y = -0.15 x - 40$ mm
band: $|y - (a x + b)| \leq 3$ mm

Surviving Points Per Gap
