

Configuration Tradeoffs For Physics

The dominant tradeoff is physical coverage versus fidelity: more spider lines help, while extending the reconstruction across more gap regions stresses the reduced model strongly.

Best Overall

lines=4, z-slices=1, gaps=1
ET complex NRMSE = 0.0958
median relative |ET| error
= 0.0519
retained points = 66,
retained z = 1

Best Multi-Gap

lines=1, z-slices=1, gaps=2
ET complex NRMSE = 37.3
median relative |ET| error
= 0.565
retained points = 19,
retained z = 2

Max Coverage

lines=4, z-slices=3, gaps=4
ET complex NRMSE = 65.9
median relative |ET| error
= 0.199
retained points = 66,
retained z = 12

Physics Takeaway

Best fidelity comes from dense in-plane sampling in a single gap. Once multiple gap regions are coupled, the error rises sharply; the 4-gap / 3-slice case is a stress test rather than a precision operating point.
